

Sales Profitability and Conversion Analysis

A data-driven review of 1,000 historical B2B sales opportunities, with emphasis on product economics, regional conversion, and commercial decision signals.

1,000 SALES OPPORTUNITIES	48.1% OVERALL CONVERSION	\$1,804.2M WON-DEAL PROFIT VALUE
---	--	--

EXECUTIVE VIEW

- GTMSys is the profit engine, contributing \$844.0 million of won-deal profit value—46.8% of the total.
- The UK supplies 55.3% of observed opportunities and 56.2% of won-deal profit value; this is opportunity concentration, not market share.
- Conversion differs across regions and products, while average deal value does not differ significantly across regions.
- Majority WSES participation is associated with a 10.2 percentage-point conversion lift; confidence classes are not statistically reliable in this sample.

Analysis completed for MFin 604 (Fall 2025) · Revised portfolio edition: August 2026

Independent academic analysis. The licensed teaching case, assignment instructions, and source workbook are not reproduced or distributed.

01 · ANALYTICAL FRAME

From course assignment to decision-ready analysis

The portfolio version preserves the group’s core statistical work while correcting units, separating descriptive evidence from causal claims, and presenting the findings as a finance and conversion analysis.

Dataset

- 1,000 historical sales opportunities across seven products and nine geographic regions.
- No missing values in the 12 source fields used for the analysis.
- Sales outcome is binary: 1 for won and 0 for not won.
- All monetary values in this report are stated in USD millions unless noted.

Constructed measures

- Profit value = profit margin × sales value.
- Conversion rate = wins ÷ opportunities.
- Marketing-expense proxy = 6% × sales value, following the course assumption.

Methods

- Descriptive statistics by product and region.
- Welch two-sample t-tests for India versus UK comparisons.
- Chi-square tests for conversion differences by region, product, and confidence group.
- One-way ANOVA for average sales value across regions.
- Two-sample proportion test for majority WSES ownership.
- Pearson correlations for deal-economics relationships.

Interpretation standard

- Statistical significance is assessed at $\alpha = 0.05$.
- Associations are not presented as evidence of causation.

Decision lens: volume, conversion, and unit economics answer different questions. A large pipeline does not prove external market share, and a correlation built from shared inputs does not establish incremental return on marketing spend.

Core performance snapshot

Metric	Result	Definition
Observed opportunities	1,000	Complete source sample
Won opportunities	481	48.1% conversion
Won-deal sales value	\$3,894.0M	Successful deals only
Won-deal profit value	\$1,804.2M	Margin × sales value
Average profit per win	\$3.75M	\$1,804.2M ÷ 481

02 · PRODUCT ECONOMICS

GTMSys drives scale; smaller products differ in conversion quality

The leading product combines the largest opportunity base with the largest absolute profit contribution. Conversion rate, however, points to a different set of product-level strengths and risks.

Product	Opps.	Wins	Conversion	Total won profit	Avg. profit / win
GTMSys	463	227	49.0%	\$844.0M	\$3.72M
LearnSys	126	71	56.3%	\$260.5M	\$3.67M
Procsys	133	69	51.9%	\$256.7M	\$3.72M
Lifesys	112	54	48.2%	\$215.9M	\$4.00M
Finsys	117	34	29.1%	\$121.7M	\$3.58M
Logissys	29	20	69.0%	\$82.4M	\$4.12M
ContactSys	20	6	30.0%	\$22.9M	\$3.82M

Portfolio implication: protect GTMSys execution because it contributes 46.8% of total won-deal profit value. Diagnose Finsys and ContactSys separately—their observed conversion rates are about 29–30%, well below the 48.1% portfolio average.

03 · REGIONAL PERFORMANCE

The UK is the portfolio’s scale market—not proven external market share

The opportunity sample is concentrated in the UK, but regional conversion varies materially. Small samples make extreme rates in Canada, Japan, Spain, and Singapore less stable.

Regional scale and conversion are different dimensions

Region	Opps.	Opp. share	Conversion	Won sales	Won profit
UK	553	55.3%	48.3%	\$2,199.4M	\$1,014.0M
Other Europe	158	15.8%	41.8%	\$512.1M	\$233.2M
Americas	104	10.4%	52.9%	\$432.8M	\$200.8M
Africa	93	9.3%	59.1%	\$423.2M	\$202.7M
India	35	3.5%	48.6%	\$145.1M	\$70.2M
Singapore	23	2.3%	26.1%	\$51.1M	\$24.0M
Japan	16	1.6%	62.5%	\$90.1M	\$43.0M
Spain	12	1.2%	8.3%	\$7.8M	\$4.3M
Canada	6	0.6%	66.7%	\$32.4M	\$12.0M

Interpretation. The UK accounts for 553 opportunities and \$1,014.0M of won-deal profit value, while converting at 48.3%, essentially the portfolio average. Africa and the Americas combine stronger observed conversion with meaningful sample sizes. Extreme rates in very small regions should be treated as directional rather than definitive.

04 · HYPOTHESIS TESTS

Conversion structure differs; average regional deal value does not

The tests separate economically visible differences from statistically supported differences. Results are observational and should inform further diagnosis rather than automatic resource shifts.

Question	Method	Statistic	p-value	Conclusion at 5%
Sales outcome × region	Chi-square	$\chi^2 = 22.26$	0.004	Significant association
Sales value across regions	One-way ANOVA	$F = 1.26$	0.261	No significant mean difference
Sales outcome × product	Chi-square	$\chi^2 = 29.03$	<0.001	Significant association
Majority WSES ownership	Two-proportion z	$z = 2.41$	0.016	Significant +10.2 pp difference
Confidence group × outcome	Chi-square	$\chi^2 = 1.72$	0.190	Not statistically significant

India versus UK: four Welch tests

Measure	India mean	UK mean	Difference	p-value
Sales value — all opportunities	\$8.19M	\$8.15M	+\$0.03M	0.935
Profit margin — won deals	48.6%	46.2%	+2.4 pp	0.409
Customer profit — all opportunities	\$1.08M	\$1.01M	+\$0.07M	0.392
Conversion rate — all opportunities	48.6%	48.3%	+0.3 pp	0.974

None of the India–UK comparisons is statistically significant. The analysis therefore does not support treating the two regions as structurally different on average deal value, successful-deal margin, customer profitability, or observed conversion.

How to use the evidence

- Use the significant region and product associations to prioritize deeper segment-level diagnostics.
- Do not interpret non-significance as proof that all markets are identical; several regional samples are small.
- Pair statistical significance with effect size, commercial scale, and operational feasibility.

05 · CONVERSION SIGNALS

Ownership is informative; confidence classification needs recalibration

Two operational signals were tested against actual outcomes. The ownership split is statistically meaningful in this sample, whereas the broad E/V versus F/L confidence grouping is not.

Joint-bid ownership

Opportunities with WSES ownership above 50% converted at 49.8%, compared with 39.6% at or below 50%. The difference is 10.2 percentage points ($p = 0.016$).

- Investigate whether majority ownership improves governance, accountability, or sales execution.
- Avoid assuming ownership itself causes the result; bid quality and deal selection may confound the relationship.

Sales confidence classes

The E/V group converted at 49.2% versus 43.9% for F/L, but the association is not statistically significant ($p = 0.190$).

- Re-estimate confidence thresholds using observed win rates and probability calibration.
- Track calibration by salesperson, product, region, and deal stage rather than relying on a pooled label.

Management action: treat majority ownership as a lead for controlled investigation, and rebuild the confidence taxonomy into a measurable forecasting tool with out-of-sample validation.

06 · DEAL ECONOMICS

One relationship is absent; the other is partly mechanical

Customer profit does not explain deal size in the observed sample. The marketing-spend relationship is strong descriptively, but its construction prevents a causal return-on-investment conclusion.

Customer profit vs. sales value

The correlation is effectively zero ($r = -0.010; p = 0.744$). Customer profit is not a useful standalone proxy for deal value in this sample.

Marketing proxy vs. profit value

The correlation among won deals is strong ($r = 0.747; p < 0.001$), but both variables contain sales value: expense is fixed at 6% of sales and profit value equals margin $\times$ sales. The relationship is therefore partly mechanical.

Prioritized recommendations

Priority	Action	Rationale
1	Protect the profit engine	Maintain GTMSys capacity and monitor whether its scale masks concentration risk by region or client.
2	Repair weak conversion	Diagnose Finsys and ContactSys by lead source, stage leakage, and competitive loss reason before reallocating spend.
3	Segment regional action	Defend UK scale; test targeted conversion improvements in Other Europe; validate smaller high-conversion regions with more data.
4	Upgrade forecasting	Replace pooled confidence labels with calibrated probabilities and periodic back-testing.
5	Measure marketing incrementally	Use actual spend and channel-level outcomes; where practical, use experiments or matched comparisons to estimate lift.

07 · APPENDIX

Definitions, limitations, and publication note

This section records the analytical boundaries needed to interpret the report responsibly and to keep the public-facing project separate from restricted course materials.

Key definitions

Term	Definition
Opportunity share	A region's proportion of the 1,000 observed leads. It is not external market share.
Won-deal profit value	Profit margin multiplied by sales value for opportunities with Sales Outcome = 1.
Conversion rate	Won opportunities divided by total opportunities within the stated group.
Majority ownership	WSES proportion in a joint bid greater than 50%.
High confidence	The combined E/V lead-conversion classes; low confidence combines F/L.
Marketing expense proxy	A modeled value equal to 6% of sales value; not observed campaign spend.

Limitations

- The sample is historical and observational; it does not establish causal effects.
- Small regional samples produce unstable conversion estimates and low expected counts in the region chi-square table.
- The dataset does not include acquisition cost, channel, salesperson, competitor, sales-cycle duration, or timing.
- The marketing analysis uses a formula-based proxy, so incremental ROI cannot be inferred.
- The report summarizes derived results only; the teaching case, assignment wording, and source rows are not reproduced.
